Apple first took the wraps off iOS 13 back in June at its annual developer conference. The update arrived in September, followed by some updates that added new features and fixed bugs. And now, as of the end of October, we're up to iOS 13.2.In terms of bringing new features, iOS 13.2 isn't anywhere near as significant as the initial iOS 13 was. Still, there are a bunch of new features in this release. If you own one of the new iPhone 11 models, iOS 13.2 adds support for Deep Fusion photography and its more detailed images. There's support for the just-announced AirPods Pro earbuds, and you can now opt out of Siri recording your requests.If that sounds like something you want right now, it's time to install iOS 13.2. Here's how to get Apple's updated OS onto your iPhone. And be sure to check out our full iOS 13 review to see how well all of the new features in that major update work, from the all-new system-wide Dark Mode to the redesigned Photos app. Should I download iOS 13.2?iOS 13.2 is the second major refinement of iOS 13 that Apple pushed out. (iOS 13.1 came out a few days after the initial release) At this point, iOS 13 should be safer and more reliable than the version that debuted in September. So you should go ahead and feel confident in downloading it, especially if you already installed iOS 13 on your iPhone and you've had a few issues with it thus far.Which iPhones support iOS 13.2?You'll be able to install iOS 13.2 on an iPhone 6s or later — basically, any phone released by Apple since 2015. That includes the iPhone SE, and iOS 13.2 runs on the 7th generation iPod touch, too.iPad owners have their own version of iOS 13. This year, Apple split iOS into two versions — one for the iPhone and one for the iPad with more tablet-centric features. iPadOS 13, which offered many of the same improvements found in iOS 13, came out in late September. To find out how to download that update, follow along with our handy guide for iPad users.Installing iOS 13.2: First make a backupAnytime you install a new OS on your iPhone, you should always back up your device first. And archiving that backup means you'll be able to jump back to the older version of iOS should this release prove unstable. (Like we said, the odds are low, but it's always good to have a backup at the ready.Here's how to back up your iPhone before installing iOS 13.2.1. Plug your iOS device into your computer and launch iTunes. Click on the iPhone icon to access your device.2. Backup your iPhone. Make sure you've selected This Computer as the location for the backup and then click Back Up Now.3. Go to the Preferences Menu and select Devices. You'll see a list of your last iPhone backups.4. Control-click on the backup you just made, and on the menu that appears, select Archive. This will prevent subsequent backups from writing over this version.How to Install iOS 13.2 from Your iPhoneWith a backup in place, you're finally ready to install iOS 13.2 on your iPhone. Here's how to do it over-the-air. (Since this is a big update, you should really do this installation over Wi-Fi, and make sure your iPhone is plugged into a power source.)1. Tap the Settings app and select General.2. Select Software Update.3. iOS 13.2 should appear there. Tap Download & Install.4. You'll be prompted to enter your passcode and then you'll need to agree to Apple's terms and conditions.From there, the iOS 13.2 update will start downloading. When it's time to install, your phone will restart. The installation process could take a while, so be patient.How to Install iOS 13.2 from iTunesSince you have to plug in your phone and make a backup anyway when installing a major iOS update, I've always found it just easier to run the installation through iTunes — at least on Macs that still run that app. (iTunes isn't part of macOS Catalina; instead, if you've upgraded to macOS Catalina, use Finder to update your iPhone's OS.)1. With your iPhone plugged into your computer, launch iTunes.2. Click on the iPhone icon near the top of the application window to go to the screen where you can manage your device.3. Click either Check for Update or Update if iOS 13.2 is already listed as available.4. Tap Install when asked if you want to install the download.5. Agree to Apple's terms of service. You may be required to enter a passcode on your iPhone or iPad. Once you've done this, the software will begin downloading and your device will reboot to start updating. iOS 12 released back in September to accompany the iPhone XS, XS Max and XR. And now, iOS 12.1 is out, bringing a few extra new features to Apple's mobile OS, like Group FaceTime calls and Depth Control for portraits.(Image credit: Tom's Guide)The software update is now live, and users have two ways of installing it on their iPhone or iPad: either via an over-the-air download, or by connecting their device to a PC or Mac equipped with iTunes.Apple has touted improved performance on older hardware with iOS 12. We tested a beta version of the update ourselves using an iPhone 6s, and found some modest gains in launching certain apps. According to Apple, some software and UI elements will open noticeably faster depending on the hardware. For example, the iPhone 6 Plus demonstrated 40 percent quicker app launches on certain occasions, based on the company's claims.MORE: 10 Awesome Hidden iOS 12 FeaturesWhat devices can install iOS 12.1?iOS 12.1 supports every iPhone dating back to and including the iPhone 5s. The iPad mini 2 is the oldest tablet iOS 12.1 supports, while the sixth-generation iPod touch is the only iPod that will be able to run the new software.How to install iOS 12.1 over the airWe recommend most users download iOS 12.1 wirelessly through their iPhones and iPads, as it's the easiest way to get the software. Here's how:1. Back up your device. It's generally a good idea to do this before any major software update, in case something goes wrong and you'd like to roll back to a previous version. You can start the backup process by going to Settings, and then tapping on your account at the top of the menu.2. Tap iCloud.3. Scroll down the page below most of the toggles, and tap iCloud Backup.4. Tap Back Up Now. This process should only take a few minutes.5. Now that you've backed up your device, you can start the update. Go back to the first screen in Settings, and tap General. Be advised that downloading the update will consume a lot of data, so you'll have to be on a Wi-Fi network to do it.6. Tap Software Update.7. Tap Download and Install, below the release notes for iOS 12.1.8. Enter your passcode and agree to Apple's terms of service. The software package will begin downloading, which will take a few minutes to complete.9. Tap Install Now to begin installing iOS 12.1, once the software has been downloaded. Your phone will reboot, and when it starts again, it'll be updated with the new software.How to install iOS 12.1 using a computerIf you're unable to update over the air, you can always trigger the update via a PC or Mac equipped with iTunes. Here's how:1. Open iTunes.2. Connect your iPhone or iPad to your computer using a USB cable.3. Once your device is connected, click on the iPhone or iPad icon near the top of the application window to go to the screen where you can manage your device.4. Click Back Up Now to manually back up the contents of your device to your computer. This will take a few minutes.5. Click Update at the top of the screen. If there is no option to update, first click Check for Update, and afterwards an option should appear.6. In the following dialog box, tap Install.7. Agree to Apple's terms of service. At this point, you may be required to enter a passcode on your iPhone or iPad. Once you've done this, the software will begin downloading and your device will reboot to start updating. When it relaunches, you'll have iOS 12.1. iOS 14.5 is about to drop and WWDC 2021 is only weeks away, so it seems this is a good moment to consider what's next for Apple's mobile systems.iPad widgets and Home screenAs recently noted here, Apple is expected to make a few changes to widgets and Home screen layouts on iPads. Principally, users will be able to place widgets anywhere on the iPad Home screen, rather than only in the Today View column. You'll also be able to replace all the apps on your Home page with widgets. And expect some changes to the lock screen also.New icon designsApple has altered the icon designs for three of its less widely used apps: Apple Music for Artists; App Store Connect; and the Apple Developers apps. All three now look more 3D, embossed, with icons surrounded by a thin lozenge-shaped border. These revamped icons may suggest a new design language for iOS, particularly as the same design lexicography is visible in macOS Big Sur.The last major iOS UI design took place in 2009.Notifications changesEnterprise users may like the improved notification controls, which become more responsive to status. Bloomberg recently claimed the OS will introduce more granular notification controls. These may include a little intelligence, so your device may not issue an incoming notification chime in the event you have set your status to driving, working, sleeping, or other custom categories.Automated message responsesThese changes to notifications could extend to message response. This means you'll be able to create automatic message responses that will be sent to others if you are contacted while working, sleeping, or involved in other activities defined by the user. At present, iOS will only share an automated response when the user is driving. Automatic message responses and notification changes should be of use to anyone trying to focus on getting work done.Control Center gets a little like Big SurThe Control Center is expected to see a redesign that makes it more consistent with Control Center on Big Sur. Apple vs. FacebookAs Facebook continues to dilute privacy in WhatsApp, Apple may move to make iMessage a more effective competitor to the service. This would extend to conversation flows that act more like social network chats rather than messages.Much more information on app privacyApple's improved privacy menu will show users which apps are collecting data about them, a move that should make it much easier to identify apps that attempt to undermine Apple's App Tracking Transparency rules.This should be a welcome step, as it will make it much easier to identify developers prepared to disclose their privacy practices in transparent fashion. It will also be of value to enterprises putting together approved-app policies.Dual biometrics?A somewhat dubious claim suggests iOS 15 will support dual biometric authentication for future devices, offering both Touch and Face ID. Conceivably this would allow users to demand both authentication methods are in place concurrently, and might also allow them to favor one above the other, such as when using Apple Pay while wearing a mask. What devices will it support?iOS 15 is currently expected to abandon support for iPhone 6S, 6S Plus and the last generation iPhone SE. The software may no longer support iPad Air 2 and the 5th-generation iPad and iPad mini. Once the OS is announced, you'll be able to check their status here.Pro apps for pro iPads?iPad critics have always been able to use the argument that Apple doesn't offer its pro apps — Final Cut Pro X, Logic Pro, and Xcode — to iPad users, not even on the iPad Pro.Might this be about to change?It's possible, at least for the latest M1-powered iPad Pro. All three apps have already been made native to run on M1-powered Macs, and while the architecture of both platforms is slightly different and memory requirements may limit what you can do with the apps when run on iPad, the fact both machines run the same processor surely makes this more likely. Adobe, meanwhile, says it is working to ensure its apps run natively on Apple's M1 computers — and its experience developing Photoshop for M1 Macs surely shows what's possible using Apple Silicon.My take? One thing you need for a pro device is pro apps, and the opportunity to build those apps for iPad Pro has never seemed greater.What Apple is sayingApple isn't discussing the future of its operating systems yet and won't do so until WWDC starts on June 7. The company, however, is foreshadowing a little of its strategy. Marketing Vice President Greg Joswiak points out that as Apple makes its devices more powerful it creates opportunities for developers."When we created the very first iPad Pro, there was no Photoshop. There were no creative apps that could immediately use it. But now there's so many you can't count. Because we created that capability, we created that performance — and, by the way, sold a fairly massive number of them — which is a pretty good combination for developers to then come in and say, 'I can take advantage of that.' There's enough customers here, and there's enough performance. I know how to use that. And that's the same thing we do with each generation. We create more headroom to performance that developers will figure out how to use."We'll find out much more about this — and the APIs Apple intends to empower its developers to innovate with — at WWDC.Please follow me on Twitter, or join me in the AppleHolic's bar & grill and Apple Discussions groups on MeWe.
